FOSS

FOSS DIGITAL CLOUD SERVICES AND INFORMATION SECURITY

FOSS is a trusted data processing partner for global and local food and agricultural companies across the globe. Since July 2019, FOSS is a certified ISO/IEC 27001 digital service provider, using Microsoft Azure as the digital cloud partner. In essence, this means that when digital services involve storing and analyzing customer data – the data is kept within highest possible performance in cloud security.

Improve scalability and security with FOSS Digital cloud services

More and more companies realise the advantages of running their services via hosted cloud solutions instead of on-premise solutions. Hosted solutions are easily scalable and enable a smarter way of working, i.e. by utilising the benefits of larger data sets(?). On top of that, most hosted solutions offer a very high level of data protection, which is continuously monitored and updated to the leading global standards.

Moving to a cloud based solution removes the need for managing local installations and reduces the work load on the internal IT organisation. Cloud solutions reduce operational risk and gives you direct access to new and evolving features and functions from leading technology providers – without carrying the investment.

At FOSS, we know that data and information are critical components for your business and we have therefore invested heavily in Information Security and internal organisational safety measures to raise the bar of being the trusted provider of analytical data and useful information that we have been for more than 60 years.

FOSS Information Security approach to your data safety

We believe that Information Security is an organisational matter. Achieving and main-taining the right level of Information Security requires the right systems and processes and not least the culture and leadership to support the continued first-class level.

This meticulous focus on Information Security has taken us to a level, where we have been granted the ISO/IEC 27001 certificate, stating our high level of information security and ability to protect valuable information in a safe and credible way.

On top of that, FOSS uses Microsoft Azure as our digital cloud partner. This partner-ship entails a cloud security level approved for governments and financial services. In combination, this ensures the highest possible performance in cloud security and reduces the risk of unauthorised access or loss of data to near zero.

With the latest accomplishments within cloud services and information security, we are confident to recommend you to move into the digital future with us!
